▼ Selectors	
Attribute selectors	[attr=value] Represents elements with an attribute name of <i>attr</i> whose value can be exactly <i>value</i> or can begin with <i>value</i> immediately followed by a hyphen, <code>-</code> (U+002D). It is often used for language subcode matches.
Class selectors	[attr^=value] Represents elements with an attribute name of <i>attr</i> whose value is prefixed (preceded) by <i>value</i>.
ID selectors	[attr\$=value] Represents elements with an attribute name of <i>attr</i> whose value is suffixed (followed) by <i>value</i>.
Type selectors	[attr*=value] Represents elements with an attribute name of <i>attr</i> whose value contains at least one occurrence of <i>value</i> within the string.
Universal selectors	[attr operator value i] Adding an <code>i</code> (or <code>I</code>) before the closing bracket causes the value to be compared case-insensitive (for characters within the ASCII range).

CSS : Cascading StyleSheets

What is cascade in CSS?

The **CSS cascade algorithm**'s job is to select CSS declarations in order to determine the correct values for CSS properties.
